

JDBC Login System - Learning Notes

Goal

The goal was to connect a Java program with a MySQL database and retrieve data from the login table.

What We Built

We created a Java program that:

1. Connects to MySQL using JDBC.
 2. Connects to the terminalchat database.
 3. Executes an SQL query.
 4. Reads data from the login table.
 5. Prints the data in the terminal.
-

Problem 1: Package Execution Error

Error

```
Error: Could not find or load main class Login
wrong name: loginpage/Login
```

Why It Happened

The Login class belonged to the package:

```
package loginpage;
```

but we were trying to run:

```
java Login
```

Java expected the class to be in the default package, but it was actually inside the loginpage package.

Solution

Run the class using its fully qualified name:

```
java loginpage.Login
```

problem 2 : nothing.

Problem 3: Missing MySQL JDBC Driver

Error

```
No suitable driver found for jdbc:mysql://localhost:3306/terminalchat
```

Why It Happened

Java did not have the MySQL Connector J driver.

Without the driver:

Java

Cannot communicate with MySQL

as jdbc api has two component : jdbc driver(which we forgot to install), and jdbc codes (to connect with database using jdbc driver)

Java understood JDBC but did not know how to talk to MySQL.

Solution

Downloaded:

```
mysql-connector-j-9.7.0.jar
```

Added it to:

```
Referenced Libraries
```

inside the project.

After adding the driver, Java could communicate with MySQL.

```
String username = "root";  
String password = "mysql";
```

How to Execute a Java Class Inside a Package

Example

```
package loginpage;  
  
public class Login  
{  
    public static void main(String[] args)  
    {  
  
    }  
}
```

Project Structure

```
src  
├──  
└── loginpage  
    ├──  
    └── Login.java
```

Steps

```
Go to Source Root (src)  
↓  
Compile using File Path  
↓  
Run using Package.Class
```

Compile

```
javac loginpage\Login.java
```

Run

```
java loginpage.Login
```

Rule

```
javac → File Path
```

```
java → Package.Class
```
